SUBSTITUTED HETEROCYCLES AND THE USES THEREOF**Field of the invention**

The present invention relates to novel substituted heterocycles, their pharmaceutical
5 compositions and methods of use. In addition, the present invention relates to therapeutic
methods for the treatment and prevention of cancers.

Background of the invention

Chemotherapy and radiation exposure are currently the major options for the treatment of
cancer, but the utility of both these approaches is severely limited by drastic adverse effects on
10 normal tissue, and the frequent development of tumor cell resistance. It is therefore highly
desirable to improve the efficacy of such treatments in a way that does not increase the toxicity
associated with them. One way to achieve this is by the use of specific sensitizing agents such as
those described herein.

An individual cell replicates by making an exact copy of its chromosomes, and then
15 segregating these into separate cells. This cycle of DNA replication, chromosome separation and
division is regulated by mechanisms within the cell that maintain the order of the steps and
ensure that each step is precisely carried out. Key to these processes are the cell cycle
checkpoints (Hartwell *et al.*, *Science*, Nov 3, 1989, 246(4930):629-34) where cells may arrest to
ensure DNA repair mechanisms have time to operate prior to continuing through the cycle into
20 mitosis. There are two such checkpoints in the cell cycle – the G1/S checkpoint that is regulated
by p53 and the G2/M checkpoint that is monitored by the Ser/Thr kinase checkpoint kinase 1
(CHK1).

As the cell cycle arrest induced by these checkpoints is a crucial mechanism by which
cells can overcome the damage resulting from radio- or chemotherapy, their abrogation by novel
25 agents should increase the sensitivity of tumor cells to DNA damaging therapies. Additionally,
the tumor specific abrogation of the G1/S checkpoint by p53 mutations in the majority of tumors
can be exploited to provide tumor selective agents. One approach to the design of
chemosensitizers that abrogate the G2/M checkpoint is to develop inhibitors of the key G2/M
regulatory kinase CHK1, and this approach has been shown to work in a number of proof of

concept studies. (Koniaras *et al.*, *Oncogene*, 2001, 20:7453; Luo *et al.*, *Neoplasia*, 2001, 3:411; Busby *et al.*, *Cancer Res.*, 2000, 60:2108; Jackson *et al.*, *Cancer Res.*, 2000, 60:566).

Summary of the invention

5 In accordance with the present invention, the applicants have hereby discovered novel compounds that are potent inhibitors of the kinase CHK1 and therefore possess the ability to prevent cell cycle arrest at the G2/M checkpoint in response to DNA damage. These compounds are accordingly useful for their anti-cell-proliferation (such as anti-cancer) activity and are therefore useful in methods of treatment of the human or animal body. The invention also relates
10 to processes for the manufacture of said fused compounds, to pharmaceutical compositions containing them and to their use in the manufacture of medicaments of use with the production of anti-cell proliferation effect in warm-blooded animals such as man.

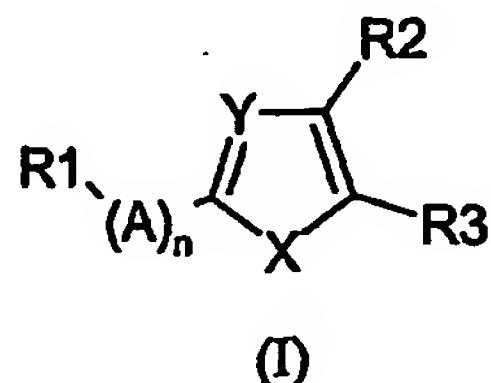

The present invention includes pharmaceutically acceptable salts or prodrugs of such compounds. Also in accordance with the present invention applicants provide pharmaceutical
15 compositions and a method to use such compounds in the treatment of cancer.

Such properties are expected to be of value in the treatment of disease states associated with cell cycle and cell proliferation such as cancers (solid tumors and leukemias), fibroproliferative and differentiative disorders, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atheroma, atherosclerosis, arterial restenosis,
20 autoimmune diseases, acute and chronic inflammation, bone diseases and ocular diseases with retinal vessel proliferation.

Definitions

The definitions set forth in this section are intended to clarify terms used throughout this application. The term "herein" means the entire application.

Unless specified otherwise within this specification, the nomenclature used in this
20 specification generally follows the examples and rules stated in *Nomenclature of Organic Chemistry, Sections A, B, C, D, E, F, and H*, Pergamon Press, Oxford, 1979, which is incorporated by references herein for its exemplary chemical structure names and rules on naming chemical structures.

Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

15

A variety of compounds in the present invention may exist in particular geometric or stereoisomeric forms. The present invention takes into account all such compounds, including cis- and trans isomers, R- and S- enantiomers, diastereomers, (D)-isomers, (L)-isomers, the racemic mixtures thereof, and other mixtures thereof, as being covered within the scope of this invention. Additional asymmetric carbon atoms may be present in a substituent such as an alkyl group. All such isomers, as well as mixtures thereof, are intended to be included in this invention. The compounds herein described may have asymmetric centers. Compounds of the present invention containing an asymmetrically substituted atom may be isolated in optically active or racemic forms. It is well known in the art how to prepare optically active forms, such as by resolution of racemic forms or by synthesis from optically active starting materials. When required, separation of the racemic material can be achieved by methods known in the art. Many geometric isomers of olefins, C=N double bonds, and the like can also be present in the compounds described herein, and all such stable isomers are contemplated in the present invention. Cis and trans geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. All chiral,

20

25

30

diastereomeric, racemic forms and all geometric isomeric forms of a structure are intended, unless the specific stereochemistry or isomeric form is specifically indicated.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such
5 substituent may be bonded to any atom on the ring. When a substituent is listed without indicating the atom via which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any atom in such substituent. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

10

As used herein, the phrase "protecting group" means temporary substituents which protect a potentially reactive functional group from undesired chemical transformations. Examples of such protecting groups include esters of carboxylic acids, silyl ethers of alcohols, and acetals and ketals of aldehydes and ketones respectively. The field of protecting group chemistry has been
15 reviewed (Greene, T.W.; Wuts, P.G.M. *Protective Groups in Organic Synthesis*, 3rd ed.; Wiley: New York, 1999).

As used herein, "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical
20 judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed
25 compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like. The pharmaceutically acceptable salts include the conventional non-toxic salts or the quaternary ammonium salts of the parent compound formed, for example,

include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like; and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, maleic, tartaric, citric, ascorbic, palmitic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, 5 toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, and the like.

The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound that contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a 10 stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. "Prodrugs" are intended to include any covalently bonded carriers that release the active parent drug according to formula (I) in vivo when such prodrug is administered to a mammalian subject. Prodrugs of a compound of formula (I) are prepared by modifying functional groups present in the compound in such a way that the modifications are cleaved, either in routine manipulation or 20 in vivo, to the parent compound. Prodrugs include compounds of formula (I) wherein a hydroxy, amino, or sulfhydryl group is bonded to any group that, when the prodrug or compound of formula (I) is administered to a mammalian subject, cleaves to form a free hydroxyl, free amino, or free sulfhydryl group, respectively. Examples of prodrugs include, but are not limited to, acetate, formate and benzoate derivatives of alcohol and amine functional groups in the 25 compounds of formula (I), and the like.

"Stable compound" and "stable structure" are meant to indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

10 An effective amount of a compound of the present invention for use in therapy of infection is an amount sufficient to symptomatically relieve in a warm-blooded animal, particularly a human the symptoms of infection, to slow the progression of infection, or to reduce in patients with symptoms of infection the risk of getting worse.

For preparing pharmaceutical compositions from the compounds of this invention, inert,
15 pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets, and suppositories.

A solid carrier can be one or more substances, which may also act as diluents, flavoring agents, solubilizers, lubricants, suspending agents, binders, or tablet disintegrating agents; it can also be an encapsulating material.

20 In powders, the carrier is a finely divided solid, which is in a mixture with the finely divided active component. In tablets, the active component is mixed with the carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired.

For preparing suppository compositions, a low-melting wax such as a mixture of fatty acid glycerides and cocoa butter is first melted and the active ingredient is dispersed therein by,
25 for example, stirring. The molten homogeneous mixture is then poured into convenient sized molds and allowed to cool and solidify.

Suitable carriers include magnesium carbonate, magnesium stearate, talc, lactose, sugar, pectin, dextrin, starch, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, a low-melting wax, cocoa butter, and the like.

Some of the compounds of the present invention are capable of forming salts with various inorganic and organic acids and bases and such salts are also within the scope of this invention.

Examples of such acid addition salts include acetate, adipate, ascorbate, benzoate, benzenesulfonate, bicarbonate, bisulfate, butyrate, camphorate, camphorsulfonate, choline, citrate, cyclohexyl sulfamate, diethylenediamine, ethanesulfonate, fumarate, glutamate, glycolate, hemisulfate, 2-hydroxyethylsulfonate, heptanoate, hexanoate, hydrochloride, hydrobromide, hydroiodide, hydroxymaleate, lactate, malate, maleate, methanesulfonate, meglumine, 2-naphthalenesulfonate, nitrate, oxalate, pamoate, persulfate, phenylacetate, phosphate, diphosphate, picrate, pivalate, propionate, quinate, salicylate, stearate, succinate, sulfamate, sulfanilate, sulfate, tartrate, tosylate (p-toluenesulfonate), trifluoroacetate, and undecanoate. Base salts include ammonium salts, alkali metal salts such as sodium, lithium and potassium salts, alkaline earth metal salts such as aluminum, calcium and magnesium salts, salts with organic bases such as dicyclohexylamine salts, N-methyl-D-glucamine, and salts with amino acids such as arginine, lysine, ornithine, and so forth. Also, basic nitrogen-containing groups may be quaternized with such agents as: lower alkyl halides, such as methyl, ethyl, propyl, and butyl halides; dialkyl sulfates like dimethyl, diethyl, dibutyl; diamyl sulfates; long chain halides such as decyl, lauryl, myristyl and stearyl halides; aralkyl halides like benzyl bromide and others. Non-toxic physiologically-acceptable salts are preferred, although other salts are also useful, such as in isolating or purifying the product.

The salts may be formed by conventional means, such as by reacting the free base form of the product with one or more equivalents of the appropriate acid in a solvent or medium in which the salt is insoluble, or in a solvent such as water, which is removed *in vacuo* or by freeze drying or by exchanging the anions of an existing salt for another anion on a suitable ion-exchange resin.

In order to use a compound of the formula (I) or a pharmaceutically acceptable salt thereof for the therapeutic treatment (including prophylactic treatment) of mammals including humans, it is normally formulated in accordance with standard pharmaceutical practice as a pharmaceutical composition.

In addition to the compounds of the present invention, the pharmaceutical composition of this invention may also contain, or be co-administered (simultaneously or sequentially) with, one

or more pharmacological agents of value in treating one or more disease conditions referred to herein.

The term composition is intended to include the formulation of the active component or a pharmaceutically acceptable salt with a pharmaceutically acceptable carrier. For example this invention may be formulated by means known in the art into the form of, for example, tablets, capsules, aqueous or oily solutions, suspensions, emulsions, creams, ointments, gels, nasal sprays, suppositories, finely divided powders or aerosols or nebulisers for inhalation, and for parenteral use (including intravenous, intramuscular or infusion) sterile aqueous or oily solutions or suspensions or sterile emulsions.

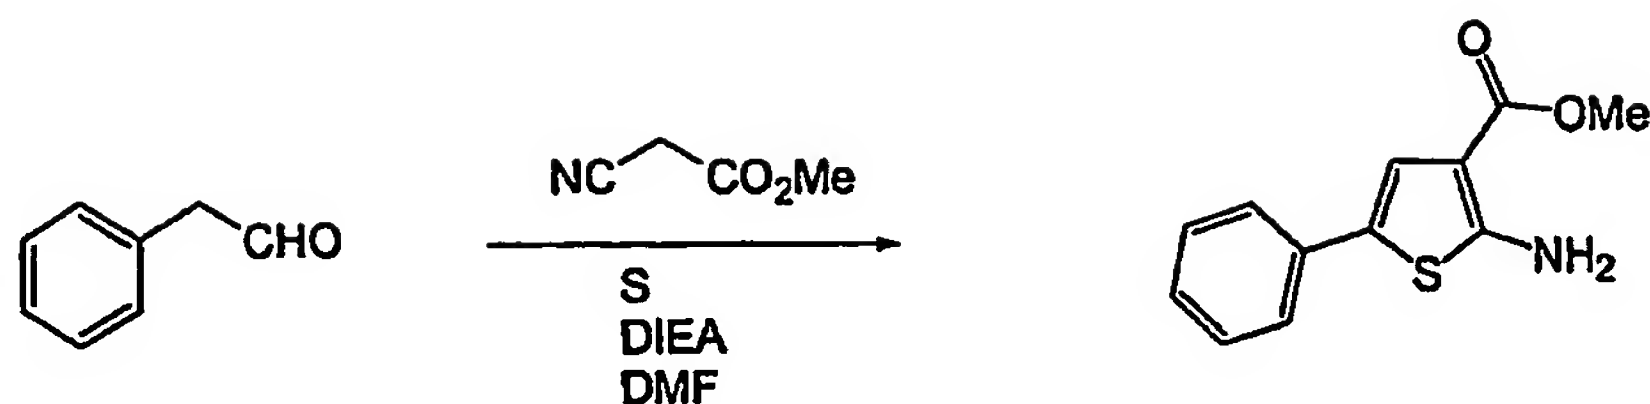

Liquid form compositions include solutions, suspensions, and emulsions. Sterile water or water-propylene glycol solutions of the active compounds may be mentioned as an example of liquid preparations suitable for parenteral administration. Liquid compositions can also be formulated in solution in aqueous polyethylene glycol solution. Aqueous solutions for oral administration can be prepared by dissolving the active component in water and adding suitable colorants, flavoring agents, stabilizers, and thickening agents as desired. Aqueous suspensions for oral use can be made by dispersing the finely divided active component in water together with a viscous material such as natural synthetic gums, resins, methyl cellulose, sodium carboxymethyl cellulose, and other suspending agents known to the pharmaceutical formulation art.

The pharmaceutical compositions can be in unit dosage form. In such form, the composition is divided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of the preparations, for example, packeted tablets, capsules, and powders in vials or ampoules. The unit dosage form can also be a capsule, cachet, or tablet itself, or it can be the appropriate number of any of these packaged forms.

Example 1

5-Phenyl-2-ureido-thiophene-3-carboxylic acid (S)-azepan-3-ylamide

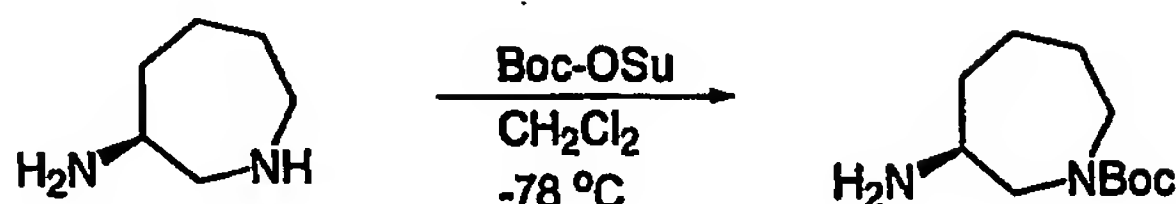

2-Amino-5-phenylthiophene-3-carboxylic acid methyl ester. To a solution of phenylacetaldehyde (12.7 mL, 100 mmol) in DMF (150 mL) was added cyanomethyl acetate (8.9 mL, 100 mmol) and sulfur (3.2 g, 100 mmol), followed by diisopropylethylamine (Hunig's Base, 17.4 mL, 100 mmol). The resultant suspension immediately turned dark yellow to brown with an exotherm. The reaction mixture was stirred overnight at room temperature. The reaction was slowly added to water (~800 mL) while stirring. An off-white precipitate formed and was filtered after an additional 30 minutes of stirring. The resultant solid was purified by column chromatography (SiO₂, 10-20% EtOAc/ Hexanes) to yield 23.2g (100%) of the title compound as an off-white solid. ¹H NMR (d₆-DMSO, δ 7.5, br s, 2H; δ 7.45, m, 2H; δ 7.33, m, 2H; δ 7.24, s, 1H; δ 7.18, m, 1H; δ 3.73, s, 3H), LC/MS (APCI, ES, M+H=234).

2-Amino-5-phenylthiophene-3-carboxylic acid. To a stirred solution of 2-Amino-5-phenylthiophene-3-carboxylic acid methyl ester (13.0g, 55.7 mmol) in MeOH (400 mL) was added 6N NaOH (200mL) and water (100mL). The reaction was heated to reflux for 2h or until starting material was gone by TLC or LCMS. The solution was concentrated under vacuum to about half of the original volume. The pH of the resultant cloudy mixture was adjusted to 3-5 by the careful addition of 6N HCl (~300 mL) while stirring. The gummy red precipitate was filtered and dried. Purification was achieved by triturating in boiling hexanes. The product (11.5g, 94%) was isolated in pure form by filtration after cooling to room temperature and drying in a vacuum oven

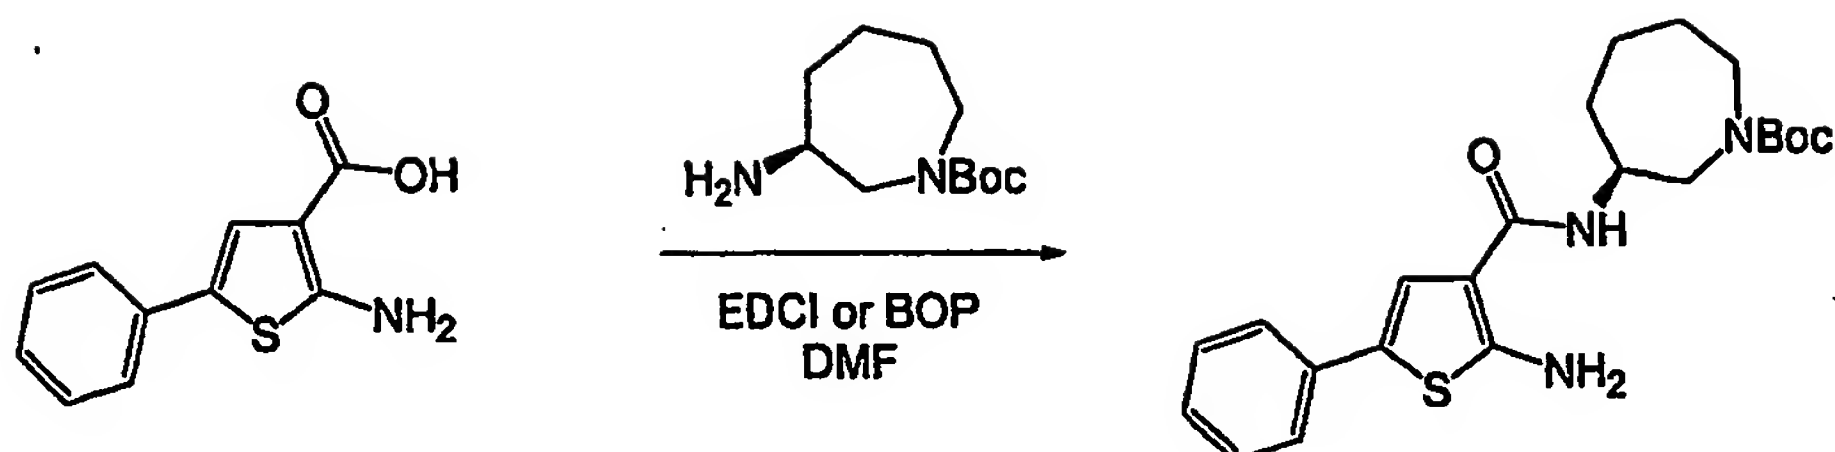

overnight. ^1H NMR (d_6 -DMSO, δ 12.0, br s, 1H; δ 7.43, m, 2H; δ 7.41, br s, 2H; δ 7.33, m, 2H; δ 7.22, s, 1H; δ 7.17, m, 1H), LC/MS (APCI, ES, $M+H=220$).

Evaporation gave a dark brown oil which was purified by Gilson (5%-95% $\text{MeCN-H}_2\text{O}$) to give the title compound as pale yellow solid (55% yield) LC/MS (ES, $\text{M}+\text{H}=233$).

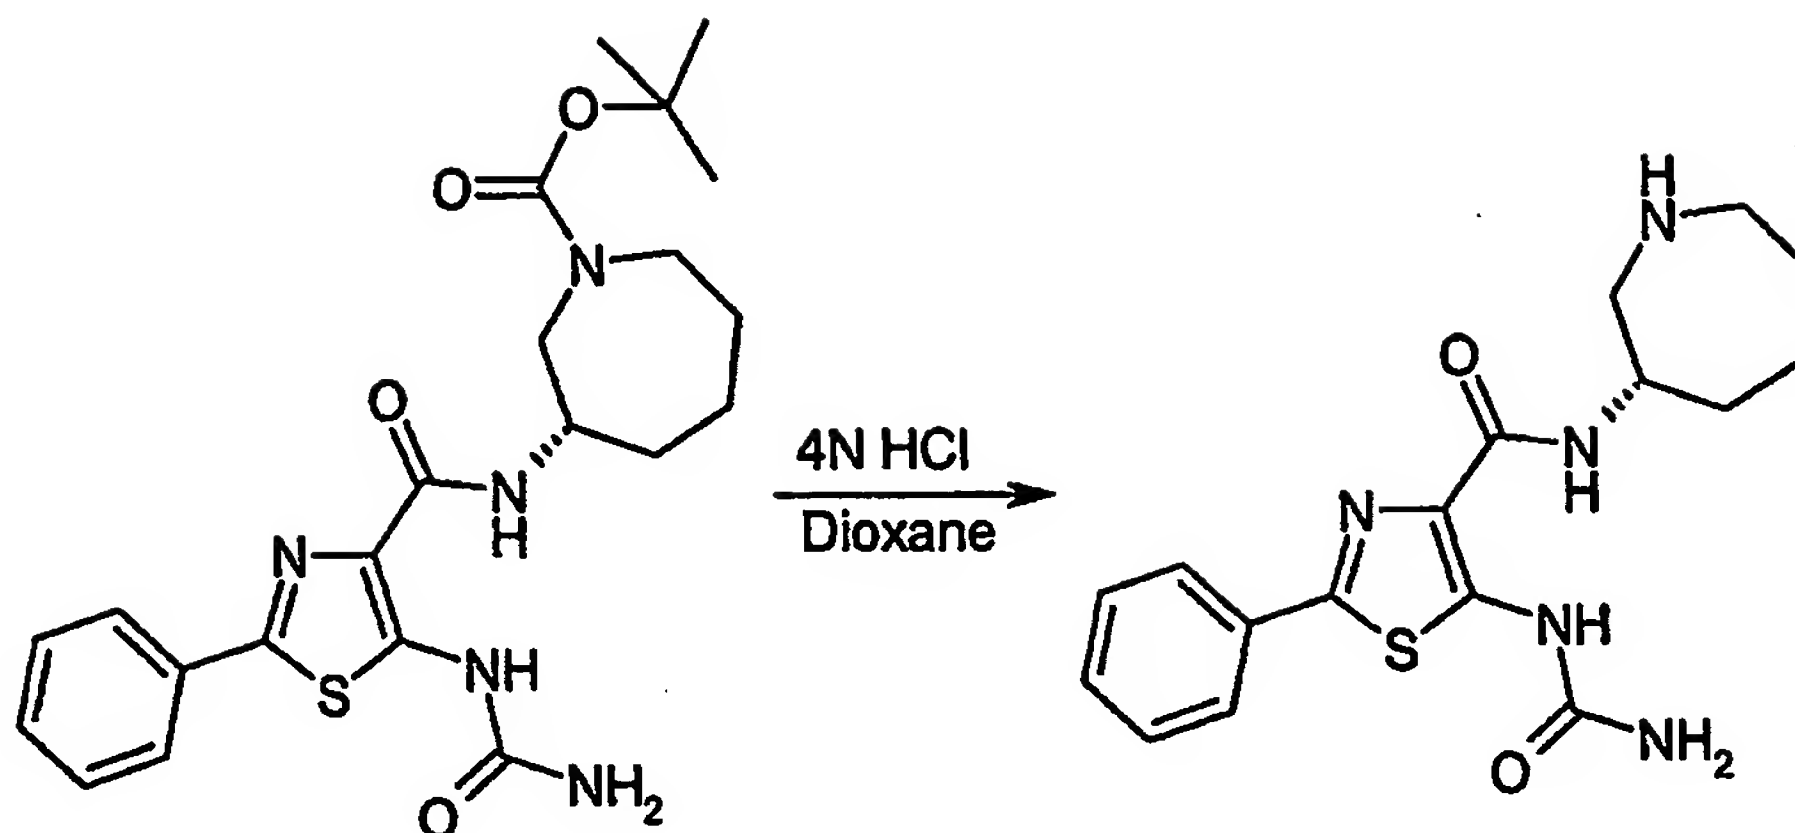

5-Amino-2-phenyl-thiazole-4-carboxylic acid ethyl ester. To a stirred solution of benzoyl aminocyano-acetic acid ethyl ester (1.0 g) in dry toluene (20 mL) was added Lawesson's reagent (1.8 g) and the resulting mixture was heated to reflux for 24 h. The mixture was diluted with EtOAc and the organic extracts were washed with H₂O, brine and dried (MgSO₄). Evaporation of the solvents gave a brown oil. Purification by Gilson (5%-95% MeCN-H₂O) afforded the title compound as yellow solid (35%). LC/MS (ES, M+H=249).

- 10 **2-Phenyl-5-(2,2,2-trichloro-acetyl)-ureido-thiazole-4-carboxylic acid ethyl ester.** To a stirred solution of 5-amino-2-phenyl-thiazole-4-carboxylic acid ethyl ester (50 mg) in anhydrous THF (1 mL) was added trichloroacetyl isocyanate (24 μ L) slowly over a period of 5 min. After the addition was complete, a precipitate formed and the reaction stirred for an additional 1h. The desired product was obtained by filtration (99% yield) as a yellow solid. The product was used in
- 15 the next step without any further purification LC/MS (ES, M+H=436).

(S)-2-Phenyl-5-ureido-thiazole-4-carbonyl]-amino}-azepane-1-carboxylic acid tert-butyl ester. To a solution of 2-phenyl-5-(2,2,2-trichloro-acetyl)-ureido-thiazole-4-carboxylic acid ethyl ester (40 mg) in anhydrous THF (2 mL) was added via cannula a solution of [Me_3Al and 3-Boc-(S)-3-aminohomopiperidine] in THF (preformed by the careful addition of Me_3Al (2.0M in hexanes, 500 μL) to a solution of (S)-3-amino-azepane-1-carboxylic acid tert-butyl ester in 5 mL of THF at 0°C and subsequently stirring at rt for 10 mins). The resulting yellow solution was stirred at rt for 10 h. The reaction mixture was cooled to 0°C and a 10% aqueous solution of Rochelle's salt was added slowly to quench the reaction. The mixture was partitioned between EtOAc and H_2O , the aqueous layer was extracted with EtOAc (3x) and the combined organic extracts were washed with H_2O , brine and dried (MgSO_4). Evaporation gave a pale yellow solid. Purification by Gilson (5%-95% $\text{H}_2\text{O}/\text{MeCN}$) gave the title compound as yellow solid (50% yield). LC/MS (ES, $\text{M}+\text{H}=460$).

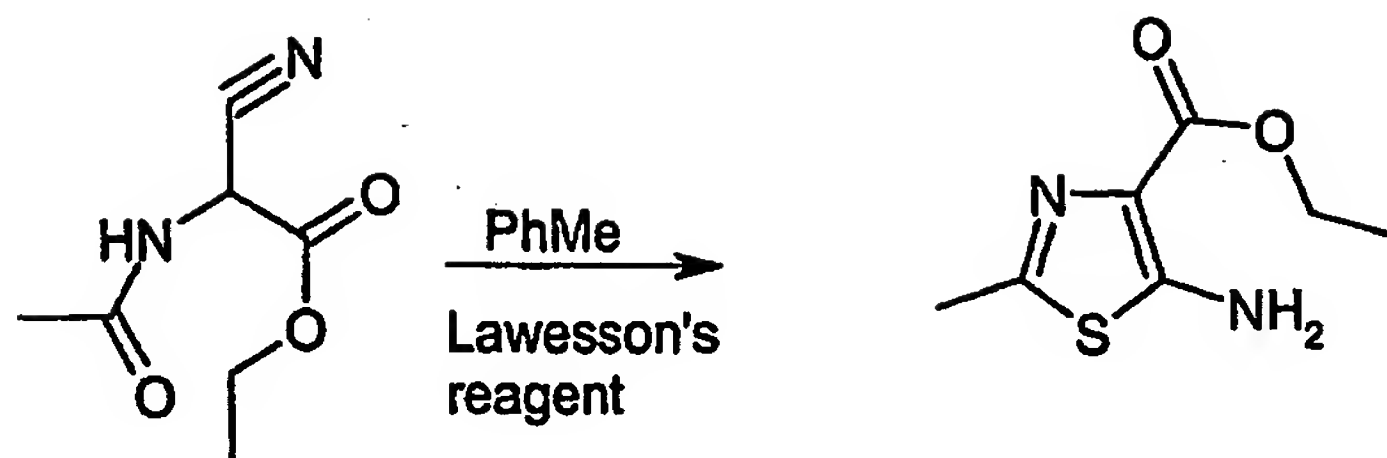

- 2-Phenyl-5-ureido-thiazole-4-carboxylic acid (S)-azepan-3-ylamide; hydrochloride. A solution of (S)-2-phenyl-5-ureido-thiazole-4-carboxylic acid (S)-azepan-3-ylamide; hydrochloride (30 mg) in 4.0N HCl in 1, 4-dioxane (3 mL) was stirred for 30 mins at rt. The cloudy solution was diluted with dry methanol and the solvents were removed under vacuum. The residue was dissolved in H₂O and placed in a lyophilizer to yield the title compound as white solid (quantitative yield). ¹H NMR (d₆-DMSO, LC/MS (ES, M+H=361).

Examples 22-23

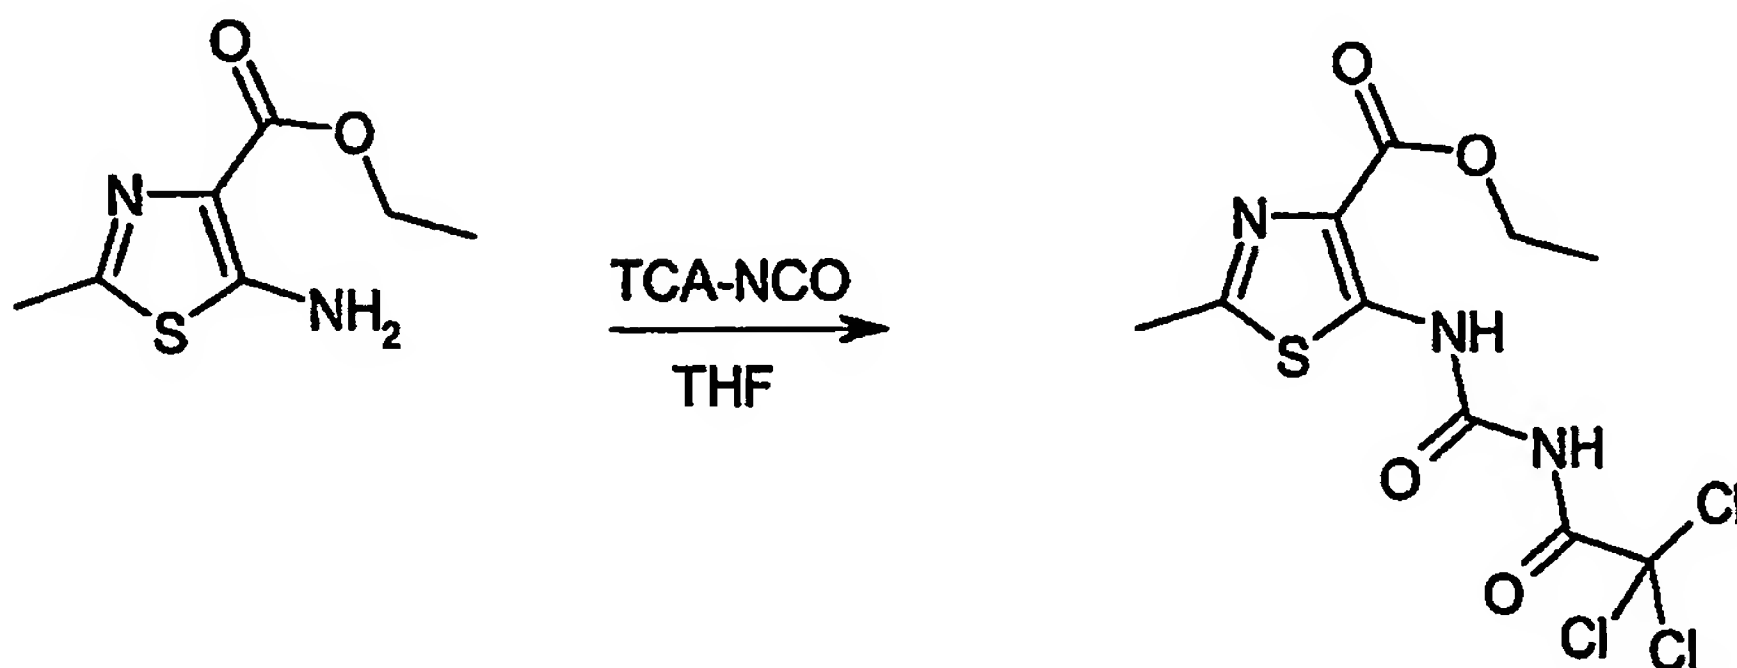

- 10 Preparation of 2-((4-methyl)-Phenyl)-5-ureido-thiazole-4-carboxylic acid (S)-piperidin-3-ylamide; hydrochloride LC/MS (ES, M+H=360) was identical to 2-Phenyl-5-ureido-thiazole-4-carboxylic acid (S)-azepan-3-ylamide; hydrochloride with the only difference of *p*-toluoyl chloride was used instead of benzoyl chloride and (S)-3-amino-Boc-piperidine was used instead of (S)-3-amino-Boc-homopiperidine.
- 15 Preparation of 2-Phenyl-5-ureido-thiazole-4-carboxylic acid (S)-piperidin-3-ylamide; hydrochloride LC/MS (ES, M+H=346) was identical to 2-Phenyl-5-ureido-thiazole-4-carboxylic acid (S)-azepan-3-ylamide; hydrochloride with the only difference of (S)-3-amino-Boc-piperidine was used instead of (S)-3-amino-Boc-homopiperidine.

5 (S)-3-[(5-Phenyl-2-ureido-thiophene-3-carbonyl)-amino]-azepane-1-carboxylic acid tert-butyl ester. A solution of (S)-3-[(5-Phenyl-2-[3-(2,2,2-trichloro-acetyl)-ureido]-thiophene-3-carbonyl)-amino] azepane-1-carboxylic acid tert-butyl ester (0.29 mmol) in anhydrous MeOH (3.0 mL) was treated with a solution of NH₃ in MeOH (2.0 M, 0.3 mL, 0.58 mmol) at room temperature. The mixture was stirred for 1h at room temperature. Concentration of the reaction mixture under vacuum gave the desired product as white solid. Purification by column chromatography (SiO₂, 50% EtOAc/hexanes) gave the desired product as an off-white solid in
 10 good yield for the two step conversion (100mg, 76%).

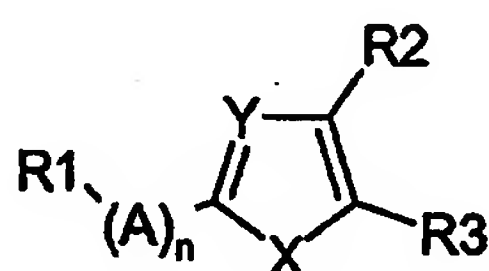

15 5-Phenyl-2-ureido-thiophene-3-carboxylic acid (S)-azepan-3-ylamide; hydrochloride. To a stirred solution of (S)-3-[(5-Phenyl-2-ureido-thiophene-3-carbonyl)-amino]-azepane-1-carboxylic acid tert-butyl ester (90 mg, 0.196 mmol) in 1, 4-dioxane (4.0 mL) was added 4.0N HCl in 1, 4-dioxane (4.0 mL, 16 mmol). A precipitate forms shortly and the reaction is stirred for an additional 4h at room temperature. Due to the hygroscopic nature of the salt form, the solvent was removed under vacuum. The residue was dissolved in methanol and concentrated under vacuum (2x) to yield an off-white solid. Recrystallization from using 2-propanol gave 60 mg (80%) of the hydrochloride salt as a white solid.
